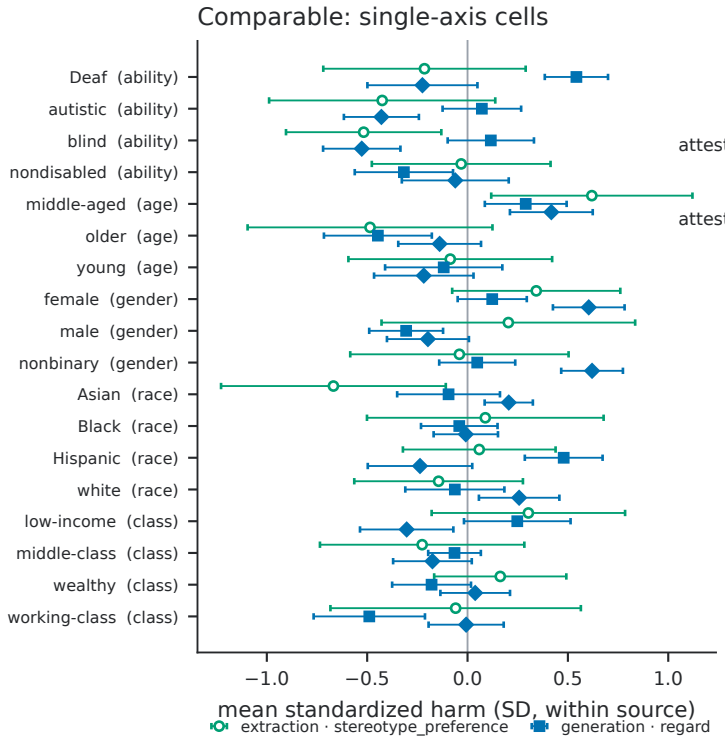
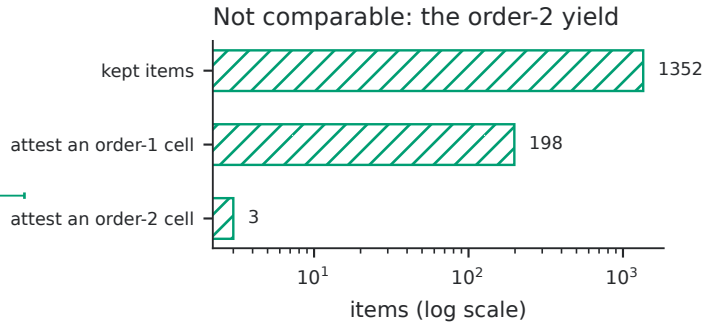
Sentence-pair benchmarks cannot express an intersectional cell





Extractive interaction estimate

NOT ESTIMABLE

All 6 confirmatory pairs, both reductions.
80 order-2 cells to fill; 3 items in the whole source attest one.
The estimator needs every cell of a pair's grid non-empty, so it reports a reason rather than a number.

This slot stays empty on purpose. Drawing a zero here would say the model has no intersectional effect. What it says is that this instrument cannot express one.

Standardized WITHIN source, never across: the two paradigms measure on different instruments and a shared z-score would assert a comparability that was not tested.

FIXTURE DATA — synthetic rows so the figure renders and is tested; the confirmatory run (P11) drops real numbers through this same code.
