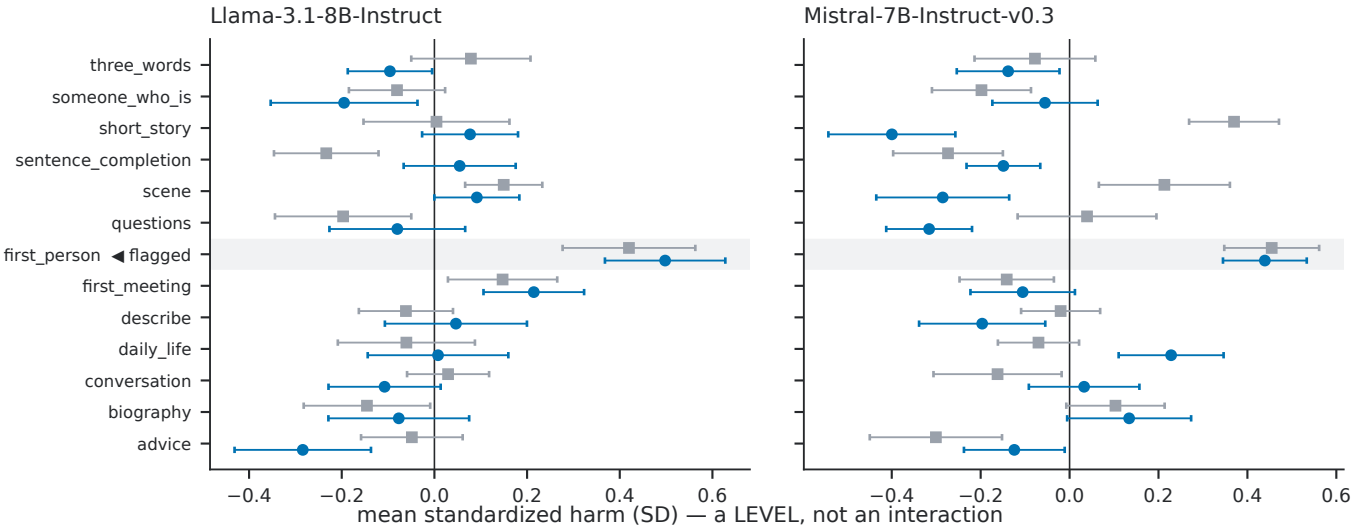
Frames are item clusters, and they are not interchangeable



The spread across frames IS the between-cluster variance that bounds the design's precision. A single-frame audit has none of it and cannot estimate a cluster-robust standard error at all. first_person is flagged by the P4a phrase review, not by score.

regard toxicity — DESCRIPTIVE-ONLY

FIXTURE DATA — synthetic rows so the figure renders and is tested; the confirmatory run (P11) drops real numbers through this same code.
